Product Description

Calcifediol / 25-Hydroxyvitamin D3 / CAS 19356-17-3 Suitable For Osteoporosis

Calcifediol, also known as 25-hydroxyvitamin D3, is a prohormone that is derived from vitamin D3. It is an important marker of vitamin D status in the body and is commonly measured in blood tests to assess an individual's vitamin D levels.

Once synthesized in the liver, calcifediol undergoes further metabolism in the kidneys to form the active form of vitamin D, known as calcitriol. Calcitriol plays a crucial role in regulating calcium and phosphorus levels in the body and is involved in maintaining healthy bone mineralization.

Calcifediol supplementation is often used to treat or prevent vitamin D deficiency, which can lead to conditions such as rickets in children and osteomalacia in adults. It may also be prescribed for individuals with certain medical conditions that impair vitamin D absorption or metabolism.

Common dietary sources of calcifediol include fatty fish, fortified dairy products, and exposure to sunlight, which triggers the synthesis of vitamin D3 in the skin. However, in cases of deficiency or inadequate sunlight exposure, supplementation with calcifediol may be necessary to maintain optimal vitamin D levels.

It is important to note that the use of calcifediol should be done under the guidance of a healthcare professional, who can determine the appropriate dosage based on an individual's specific needs and monitor their response to treatment. Adverse effects associated with calcifediol supplementation are rare but may include gastrointestinal disturbances and hypercalcemia in excessive doses.
