Product Description

Anti-tumor Dapagliflozin Powder CAS 61432-26-8 Raw materials Organic intermediates

Dapagliflozin is a medication used to treat type 2 diabetes. It belongs to a class of drugs known as sodium-glucose co-transporter 2 (SGLT2) inhibitors.

Dapagliflozin works by blocking the reabsorption of glucose by the kidneys, which leads to increased glucose excretion in the urine. By reducing the amount of glucose reabsorbed, dapagliflozin helps lower blood sugar levels in individuals with type 2 diabetes.

In addition to its blood sugar-lowering effects, dapagliflozin has also been found to have other benefits. It can help promote weight loss and reduce blood pressure in individuals with diabetes. This is because the increased excretion of glucose in the urine also leads to the loss of calories and excess fluid from the body.

Dapagliflozin is typically taken orally, usually once a day. It can be used alone or in combination with other diabetes medications, such as metformin or insulin. The dosage prescribed may vary depending on individual factors and the specific treatment plan determined by a healthcare provider.

Like any medication, dapagliflozin may have side effects. Common side effects include urinary tract infections, genital yeast infections, increased urination, and low blood pressure. It is important to discuss any concerns or potential side effects with your healthcare provider.

Dapagliflozin should only be used under the guidance and supervision of a healthcare professional. It is important to follow the prescribed dosage and instructions provided, as well as to maintain regular monitoring of blood sugar levels and other relevant parameters as advised by your doctor.
